

Rollertrap Instructions

Directions for use

Size : 30cm x 100mts / 15cm x 100mts / 30cm x 20mts

Two sided sticky glue trap on a roll

Mini-Rollertraps are designed to catch high numbers of flying pests when there is a high pest volume. For instance when there is high numbers of White fly adults. Mini-Rollertraps can also be used for catching Thrip, Aphid, Leafminer and Fungus fly. Mini-Rollertraps are available in two colours; Yellow or Blue. For general pest catching and for catching Whitefly adults use Yellow traps. If Thrip is the problem pest, it is recommended to use Blue traps. Suspend the Mini-Rollertraps above the growing points of the crops unless the pest is Fungus fly. For this pest suspend the Mini-Rollertraps near the compost or soil surface. It is a good idea to hang Mini-Rollertraps up when greenhouses are empty in the winter, as they will catch any pests that are trying to overwinter in the greenhouse. Do not introduce flying beneficial insects to greenhouses when using yellow Mini-Rollertraps as they will also be caught on the trap.

How to use Mini-Rollertrap

- Ensure that the Mini-Rollertrap is at room temperature, this ensures the glue is softer and the roll un-rolls easier.
- Suspend a wire/string in the greenhouse at the required height.
- This is ideally a 2 person job, with one person holding the roll whilst the other person holds the end of the roll moving away along the length of the wire/string.
- Attach the Mini-Rollertrap to the wire/string with household pegs/paper clips or similar at approximately every 20cm
- Ideally you should attach similar pegs to the bottom of the Mini-Rollertrap to weight the trap as shown in Diagram 2.

Oecotak glue doesn't come off clothing very easily, therefore wear protective clothing, a general solvent can be used to remove from surface areas and if required use a hand cleaner with pumice.
